Store IT: Medium-Fi Prototype README

SPP6 | CMPS3141 Human Computer Interfaces | University of Belize
Amber Gill, Cristina Gonzales, Wasani Castillo

1. About the app

Store IT is a science lab inventory app. Lab technicians, lecturers and student assistants would use it when they need to find a lab item, record that something was used or moved, or check what is running low or expired, instead of searching several storerooms or updating a spreadsheet by hand.

2. How to open the prototype

- Link: **[PASTE APPSHEET LINK]**. Open it in a phone or computer browser.
- If AppSheet asks you to sign in, use your Google account. *[CONFIRM: does the link need sign-in, or can anyone open it?]*
- If the link does not work, use the backup walkthrough video on our website.

3. What a user can do in the prototype

The five tabs at the bottom are **Equipment list**, **Chemicals list**, **Glassware list**, **Office gallery** and **Slides deck** (these are microscope slides, not presentation slides). The search icon is at the top right and the round + button adds a new item.

- **Task 1, Simple: find an item and where it is.** Open the matching tab, or use the search icon, and open the item. *[CONFIRM: which screen shows the item's location?]*
- **Task 2, Moderate: keep the inventory accurate.** Use the pencil (edit) icon on an item, or the three-dot menu on a chemical, to update its details. *[CONFIRM: what exactly can be changed, and does the StockLog record it?]*
- **Task 3, Complex: notice low stock and restock.** The Chemicals list shows a status on each item (In Stock, Low Stock, Out of Stock, Expired). Spot a Low Stock item, then use the + button to add the restocked item. *[CONFIRM: list the fields on the add form]*

4. Tool used

AppSheet (Google). The course required AppSheet for this prototype instead of coding it. *[CONFIRM: data source, e.g. Google Sheets]*

5. Limitations

- This is a prototype to test the three tasks. It is not a finished system.
- The screens follow AppSheet's built-in layouts, so the design is less customizable than a coded app.
- Low-stock and expiry are shown as labels in the lists. *[CONFIRM: do real notifications or alerts exist?]*
- QR code scanning and the login roles from our design (technician, guest, admin) *[CONFIRM: say what is and is not built, e.g. QR scanning, role-based access, separate labs]*.
- Edit and delete icons are visible on some lists, so they are not restricted by role in this prototype. *[CONFIRM: true?]*

6. Hard-coded data and Wizard of Oz

- All items (equipment, chemicals, glassware, office supplies, microscope slides) are sample data entered in advance, so evaluators can try the tasks without real inventory.
- Wizard of Oz: *[CONFIRM: list anything done by hand, or write 'None']*
