# Store IT: Medium-Fi Prototype README

SPP6 | CMPS3141 Human Computer Interfaces | University of Belize
Team: Amber Gill, Cristina Gonzales, Wasani Castillo | November 2026

## 1. About the app

Store IT is a science lab inventory app. Lab technicians, lecturers and student assistants would use it when they need to find a lab item and see where it is, record that something was received or used, or check what is running low, empty or expired, instead of searching several storerooms or updating a spreadsheet by hand.

## 2. How to open the prototype

- Link: https://www.appsheet.com/start/62eae742-056b-4bb2-9ba7-b9b2ba2b7e73
- Open it in a phone or computer browser. If AppSheet asks you to sign in, use your Google account.
- Navigation: five tabs along the bottom (Equipment list, Chemicals list, Glassware list, Office gallery, Slides deck), a search icon at the top right, and a three-line menu icon at the top left. The Slides deck tab holds microscope slides, not presentation slides.

## 3. What a user can do (the three tasks)

**Task 1, Simple: find an item and where it is.**

- Open the Chemicals list tab (or the tab for the kind of item you want).
- Tap the search icon and type part of a name, for example "Sulfate".
- Tap the item to open its details, such as chemical name, ChemID, CAS number and date received.
- Voice search: open the menu (top left), choose Assistant, and speak or type a request, for example "show the StockLog rows where Action equals Received".

**Task 2, Moderate: keep the inventory accurate after using an item.**

- Find the item as in Task 1 and open it.
- Tap the Edit (pencil) button, change the record's details, and tap Save.
- The stock log (Assistant) lists what was received or used, with the date, amount, who used it and why.

**Task 3, Complex: notice low stock and restock it.**

- On the Chemicals list, each chemical shows a status: In Stock, Low Stock, Out of Stock or Expired. Look for Low Stock, Out of Stock or Expired items.
- Tap the round + button to open the Chemicals Form, fill in the details (ChemID, CAS number, chemical name, date received, room), and tap Save to add the restocked item.

## 4. Tool used

AppSheet (Google). The course required AppSheet for this prototype instead of a coded app. Screens are built from data tables, such as the StockLog table behind the stock log.

## 5. Limitations

- This is a prototype to test the three tasks. It is not a finished system.
- Not built: QR code scanning, role-based logins and separate labs, and automatic notifications. Low stock, out of stock and expired items are shown as status labels only.
- Layouts follow AppSheet's built-in views, so the design could not match our sketched dashboard exactly.
- Edit and delete icons appear on some lists for everyone, because there are no user roles.
- Anything you add or edit is saved to the prototype's sample data, so other evaluators may see your changes.

## 6. Wizard of Oz

The inventory data is simulated. We entered it by hand to stand in for a live inventory. No real lab stock is connected to the app, and no live data has been entered.

## 7. Hard-coded data

All equipment, chemicals, glassware, office supplies, microscope slides and stock log entries are sample data entered in advance, so evaluators can try all three tasks without a real inventory.
